

I like this version because it's focused. It reads like something a designer and engineer would actually use, rather than repeating the PRD. I've kept it deliberately concise and implementation-oriented.

02. UX Design Specification (V1)

Product

Mot-à-Mot

1. UX Goals & Design Principles

UX Goals

The user experience should be:

- **Fast** – Enable users to verify and improve a French message in under 20 seconds.
 - **Intuitive** – The interface should require no onboarding or instructions.
 - **Supportive** – Corrections should build confidence, not discourage learners.
 - **Educational** – Every correction should help users understand the underlying rule.
 - **Low Friction** – Users should be able to return to their messaging app with minimal interruption.
-

UX Principles

1. One Screen, One Goal

Each screen should focus on a single task:

- Landing → Write
 - Loading → Wait
 - Results → Review & Copy
-

2. Communicate Before You Teach

Show the corrected message first. Grammar explanations should support, not interrupt, the user's primary goal of sending a message.

3. Reduce Cognitive Load

Present information in small, scannable sections using cards, tables, and concise explanations.

4. Teach Through Corrections

Every correction should include a simple explanation that helps the user avoid repeating the mistake.

5. Never Break the Conversation Flow

The product exists to support real conversations. Every interaction should help users return to their messaging app as quickly as possible.

2. Screen Architecture

The MVP consists of three screens only.

There are no menus, navigation bars, user profiles, or settings.

3. Interaction Patterns

The following interaction patterns should remain consistent throughout the application.

Pattern	Guideline
Primary Action	Only one primary CTA per screen
Layout	Card-based information hierarchy
Workflow	Linear progression (Write → Review → Copy)

Pattern	Guideline
Copy Action	Always completed in one tap
Feedback	Immediate visual confirmation for all user actions
Mobile Experience	Mobile-first layout with responsive scaling
Information Density	Show only essential information; avoid long paragraphs

4. Landing Screen Specification

Purpose

Allow users to immediately begin writing or speaking their French message.

Components

Component	Type	Required	Behaviour
App Title	Heading	Yes	Displays "Mot-à-Mot"
Tagline	Text	Yes	"Write confidently. Learn naturally."
Prompt	Label	Yes	"What do you want to say in French?"
French Input	Multi-line text area	Yes	Accepts typed French text
Placeholder	Helper Text	Yes	"Je ne peux pas venir aujourd'hui."
Microphone	Icon Button	No	Starts voice input
Check My French	Primary Button	Yes	Submits text for AI analysis; enabled only when input is not empty

5. Loading Screen Specification

Purpose

Provide feedback while the AI processes the user's message and reduce perceived waiting time.

Components

Component	Type	Required	Behaviour
Loading Indicator	Animation	Yes	Indicates active processing
Rotating Status Message	Text	Yes	Displays encouraging messages every 1–2 seconds

Loading Messages

- ✨ Looking for the most natural way to say it...
- 📝 Checking grammar...
- ✨ Polishing your message...
- 📖 Every correction is one step closer to fluency.
- 🇫🇷 Almost ready...

6. Results Screen Specification

Purpose

Present corrections in a clear order that prioritizes communication while supporting learning.

Components

Component	Type	Required	Behaviour
What I Understood	Information Card	Yes	Displays the AI's English interpretation of the message
Ready to Send	Information Card	Yes	Displays the corrected French message
Copy Message	Primary Button	Yes	Copies the corrected message to the clipboard
Changes Made	Comparison Table	Yes	Displays each correction alongside a beginner-friendly

Component	Type	Required	Behaviour
Why These Changes?	Information Card	Yes	Explains the relevant grammar concepts using simple language
Grammar Rating	Progress Bar	Yes	Indicates grammatical accuracy of the original sentence
Naturalness Rating	Progress Bar	Yes	Indicates how naturally the original sentence would sound to a native speaker

Information Hierarchy

- 1. What I Understood
- 2. Ready to Send
- 3. Changes Made
- 4. Why These Changes?
- 5. Grammar Rating
- 6. Naturalness Rating

The corrected message and **Copy Message** button should be the most visually prominent elements on the page.

7. Error States

Screen	Scenario	User Feedback
Landing	Empty input	"Please enter or speak a sentence in French."
Landing	Voice transcription failed	"We couldn't hear that clearly. Please try again or type your sentence."
Loading	AI request failed	"We couldn't check your sentence right now. Please try again."
Results	Copy failed	"Unable to copy. Please try again."

8. Feedback Principles

The product should communicate using encouraging, supportive language.

Guidelines

- Focus on improvement rather than mistakes.
- Avoid language that feels judgmental or academic.
- Keep explanations concise and beginner-friendly.
- Reinforce learning through positive microcopy.

Examples

Avoid

Your sentence is wrong.

Incorrect grammar.

Error.

Prefer

Here's a more natural way to say it.

This small change makes the sentence sound more natural.

Let's fix this together.

9. Accessibility

The interface should:

- Be fully responsive across desktop and mobile devices.
- Maintain sufficient colour contrast for readability.
- Support keyboard navigation.
- Provide large touch targets for interactive elements.
- Use clear visual hierarchy through spacing and typography.
- Avoid relying solely on colour to communicate information.

10. UX Success Metrics

The UX will be considered successful if users can:

- Complete their first sentence correction without assistance.
- Understand the corrected message within **3 seconds** of viewing the results screen.
- Locate the **Copy Message** button without scrolling.
- Complete the primary task (Write → Check → Copy) in **three taps or fewer**.
- Return to their messaging app within **20 seconds**.

My only suggested addition

I'd add a tiny section at the very beginning called **Design Intent** (2–3 sentences):

Mot-à-Mot is designed as a lightweight writing assistant rather than a comprehensive language-learning platform. The experience prioritizes speed, clarity, and confidence so users can quickly improve and send their messages without interrupting the flow of conversation.

I think that's worth including because it reminds every future designer or engineer *what kind of product they're building*. It becomes a north star whenever there's a question like, "Should we add this feature?" If it slows down the messaging workflow, the answer is probably no.
